

ABSTRACT

[98] Aspects of the invention provide a method and system for communicating information in a distributed media network. The communication of information in a distributed media network may include detecting availability of new media, data and/or service and migrating the newly available media, data and/or service to at least a first media processing system within the distributed media network. The migrated media, data and/or service may be stored at a first media processing system. If the stored media, data and/or service is to be processed, then the media, data and/or service may be migrated to a media view and/or a channel view associated with a media processing system. If the newly available migrated media, data and/or service is to be pushed, then the migrated media, data and/or service may be pushed to a second media processing system and/or a personal computer coupled to the media exchange network.
